SUMMARY

Backend-leaning engineer with continuous product work in JavaScript/TypeScript since 2017. I design and ship the server side of multi-service platforms: Node APIs (Express), SQL schemas, indexers that talk to chain RPC, wallet-aware flows, and ops on Fly.io/Docker. Most relevant recent work is a Web3 stack on Base plus a private EVM chain — marketplace, DEX, token/DeFi panel, trading bots, and a Postgres-backed block explorer. Comfortable owning ambiguous requirements end to end and keeping services secure and online.

SKILLS

Runtime: Node.js, TypeScript, JavaScript · Express · server routes / SSR adapters · JSON APIs

Architecture: multi-app platforms, service boundaries, RPC clients (HTTP JSON-RPC to Geth/EVM), webhooks, background jobs, retries

Data: PostgreSQL (indexer schemas, migrations, pagination), SQL, Turso/libSQL, Drizzle ORM · relational modeling for product + on-chain sync

Blockchain: EVM (Base + custom Clique PoA), viem, wallet auth, token/NFT/DEX flows, indexer lag/health, on-chain ↔ off-chain sync

Security & reliability: auth/session boundaries, secret handling, input validation, least-privilege deploy secrets, Docker/Fly volumes, restart-safe workers

Also: Redis (usage in tooling/caches where needed) · Rust (Resuma SSR framework, SQL-backed apps) · Qwik City · Linux · GitHub Actions

EXPERIENCE

Backend & Web3 Engineer

Gravitad (project accelerator, Spain) · Remote · 2022 – Present

- Own backend and data paths for the Koolinart / Orionchain platform: several Node/TypeScript services that share contracts, wallets, and SQL stores.
- Built a production block explorer indexer against Geth JSON-RPC — Postgres schema, sync loop, paginated tx/address queries, lag/health checks, SSE live feed.
- Implemented server-side trading bots (20 wallets per bot, randomized swaps) that persist state and self-resume after deploys/crashes.
- Wire marketplace / DEX / token panel backends to Base and Orionchain RPCs; keep off-chain indexes consistent with on-chain events.
- Work with product and frontend on practical API shapes; ship behind Docker + Fly.io with CI deploy gates (build, lint, format).

Independent Software Engineer

Own products & client systems · Remote · 2017 – Present

- Shipped production Node/TypeScript backends for education (MOA), ops tools (Iriparo service orders), crypto dashboards (Crypto Helper: sync jobs, Drizzle/Turso, alerts), and DeFi utilities (Save TimeLock).
- Designed schemas and query paths for attendance, reporting, role-based dashboards, order tracking, and market data — including PDF/QR flows and third-party API integrations.
- Operated full lifecycle: requirements → service design → implementation → deploy → debugging production issues across API, DB, and infra.
- Author of Resuma (Rust SSR framework on crates.io) — systems work that informs how I think about server boundaries, RPC-style server actions, and low-overhead backends.

SELECTED SYSTEMS (LIVE / PRODUCTION)

- | | |
|--|---|
| • Block explorer + Postgres indexer — koolinart-block-explorer.fly.dev | • NFT marketplace (Base) — koolinart.fly.dev |
| • Private EVM (Geth Clique, 2-node) — Fly-hosted RPC for Orionchain | • Token / DeFi hub — koolinart-token.fly.dev |
| • DEX (Uniswap V3-style) — koolinart-dex.fly.dev | • Crypto Helper — market sync + DB-backed modules |
| • Volume bots (Node workers) — Orionchain + Base | • MOA Education — moaeducation.com |

EDUCATION & LANGUAGES

Universidad de Los Andes (ULA) — Licenciado en Física (Bachelor's in Physics). Used to hard problems, modeling, and careful debugging.

Languages: Spanish (native) · English (advanced — daily for docs, code, APIs, remote collaboration).

Targeting Senior Backend Developer roles with Node.js, SQL, RPC between services, and blockchain-adjacent platforms. Open to remote from Venezuela with overlap for Oslo / EU hours.
